

Object-patch reader: crop -> patch similarity -> rerank

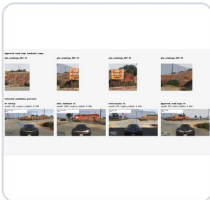

The approved road-sign crop is compared against candidate frame patches to pick the best continuation.

external memory read

top-k patch similarity

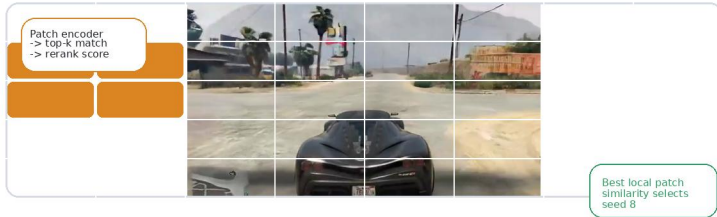

not internal attention

Memory crop

External memory unit.

Candidate frame with patch grid

memory crop -> patch encoder

candidate patches -> top-k similarity

rerank -> selected output

The reader is external and local: it compares object patches to a memory crop, then reranks candidates.
