

External Visual Memory Reranking for Frozen Game World Models

Anonymous CVPR submission

Paper ID AP0006

Abstract

001 TODO: Write after Stage A and Stage C are finalized.
002

003 1. Introduction

004 TODO: Short motivation about memory modules in
005 world models.

006 2. Stage A: MatrixGame 3.0 Memory Analysis

007 Team placeholder. This section is reserved for the
008 team member responsible for analyzing MatrixGame
009 3.0. The final version should describe where Ma-
010 trixGame 3.0 writes, reads, and updates memory; what
011 data structure is used; which code locations implement
012 the mechanism; and how one concrete input example
013 demonstrates memory influence.

014 3. Stage C: External Memory Reranking on 015 MatrixGame-2

016 TODO: Our main contribution. We keep MatrixGame-
017 2 frozen and implement an external inference-time
018 memory module.

019 4. Experiments and Results

020 TODO: Add at most two figures and one compact ta-
021 ble.

022 5. Limitations and Conclusion

023 TODO: External reranking only; limited scenes/seeds;
024 Stage A pending.
